

Low-Power, Slew-Rate-Limited RS-485/RS-422 Transceiver

DESCRIPTION

The MAX485 is low-power transceivers for RS-485 and RS-422 communication. The IC contains one driver and one receiver. The driver slew rates of the MAX485 is not limited, allowing them to transmit up to 2.5Mbps. These transceivers draw between 120 μ A and 500 μ A of supply current when unloaded or fully loaded with disabled drivers. All parts operate from a single 5V supply. Drivers are short-circuit current limited and are protected against excessive power dissipation by thermal shutdown circuitry that places the driver outputs into a high-impedance state. The receiver input has a fail-safe feature that guarantees a logic-high output if the input is open circuit. The MAX485 is designed for half-duplex applications.

(Top View)

FEATURES

- Low Quiescent Current: 300 μ A
- -7V to +12V Common-Mode Input Voltage Range
- Three-State Outputs
- 30ns Propagation Delays, 5ns Skew
- Operate from a Single 5V Supply
- Allows up to 32 Transceivers on the Bus
- Data rate: 2.5 Mbps
- Current-Limiting and Thermal Shutdown for Driver Overload Protection
- The transmitter outputs and receiver inputs are protected to ± 15 kV Air ESD

APPLICATION

- Low-Power RS-485 Transceivers
- Low-Power RS-422 Transceivers
- Level Translators
- Transceivers for EMI-Sensitive Applications
- Industrial-Control Local Area Networks

PIN DESCRIPTION

No.	Name	Function
1	RO	Receive output: if $A > B$ by 200mV, RO will be high; if $A < B$ by 200mV, RO will be low.
2	\overline{RE}	Receiver Output Enable. RO is enabled when \overline{RE} is low; RO is high impedance when \overline{RE} is high.
3	DE	Driver Output Enable. The driver outputs are enabled when DE is high. They are high impedance when DE is low. If the driver outputs are enabled, the parts function as line drivers. While they are high impedance, they function as line receivers if \overline{RE} is low.
4	DI	Driver input. A low on DI forces output A low and output B high. Similarly, a high on DI forces output A high and output B low.
5	GND	Ground
6	A	Driver Output and Receiver differential input.
7	B	Driver Output and Receiver differential input.
8	V _{CC}	Positive Supply: $4.75V \leq V_{CC} \leq 5.25V$

- Notes**
- 1: All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground unless otherwise specified.
 - 2: All typical specification are given for $V_{CC} = 5\text{V}$ and $T_A = +25^\circ\text{C}$
 - 3: Supply current specification is valid for loaded transmitters when $DE = 0\text{V}$.
