

- PC(user end) running a hyperterminal console
- UART0 (RS232 connector) on the SDK is connected to the PC
- The user types in 'ON' or 'OFF' in the console which is passed from UART0 to the TMS320DM355
- This instruction of 'ON' or 'OFF' is signaled via UART1 to the EASYPIC5
- EASYPIC5 has been already programmed with the init code for the OLED.
- When the PIC receives 'ON' command from the DM355 it calls upon the init code and switches ON the OLED
- When the PIC receives 'OFF' command from the DM355 it calls upon the init code and switches OFF the OLED
