

## LM431

## **Adjustable Precision Zener Shunt Regulator**

### **General Description**

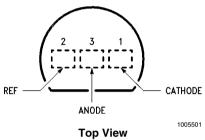

The LM431 is a 3-terminal adjustable shunt regulator with guaranteed temperature stability over the entire temperature range of operation. The output voltage may be set at any level greater than 2.5V ( $V_{\rm REF}$ ) up to 36V merely by selecting two external resistors that act as a voltage divided network. Due to the sharp turn-on characteristics this device is an excellent replacement for many zener diode applications.

#### **Features**

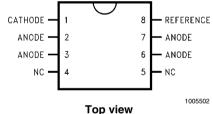

- Average temperature coefficient 50 ppm/°C
- Temperature compensated for operation over the full temperature range
- Programmable output voltage
- Fast turn-on response
- Low output noise

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Electrical specifications do not apply when operating the device beyond its rated operating conditions.

Note 2:  $T_{J \text{ Max}} = 150^{\circ}\text{C}$ .

Note 3: Ratings apply to ambient temperature at 25°C. Above this temperature, derate the TO-92 at 6.2 mW/°C, the SO-8 at 6.5 mW/°C, the SOT-23 at 2.2 mW/°C.

Note 4: Deviation of reference input voltage, V<sub>DEV</sub>, is defined as the maximum variation of the reference input voltage over the full temperature range.

The average temperature coefficient of the reference input voltage,  $V_{REF}$ , is defined as:

$${}_{\propto}\text{V}_{\text{REF}} \frac{\text{ppm}}{{}^{\circ}\text{C}} = \frac{\pm \left[\frac{\text{V}_{\text{Max}} - \text{V}_{\text{Min}}}{\text{V}_{\text{REF}} \left(\text{at 25}^{\circ}\text{C}\right)}\right] 10^6}{\text{T}_2 - \text{T}_1} = \frac{\pm \left[\frac{\text{V}_{\text{DEV}}}{\text{V}_{\text{REF}} \left(\text{at 25}^{\circ}\text{C}\right)}\right] 10^6}{\text{T}_2 - \text{T}_1}$$

Where:

 $T_2 - T_1 = \text{full temperature change (0-70°C)}.$ 

 $\ensuremath{V_{\text{REF}}}$  can be positive or negative depending on whether the slope is positive or negative.

Example:  $V_{DEV} = 8.0$  mV,  $V_{REF} = 2495$  mV,  $T_2 - T_1 = 70$ °C, slope is positive.

$${}_{\propto} V_{REF} = \frac{\left[\frac{8.0 \text{ mV}}{2495 \text{ mV}}\right] 10^6}{70^{\circ} \text{C}} = +46 \text{ ppm/}^{\circ} \text{C}$$

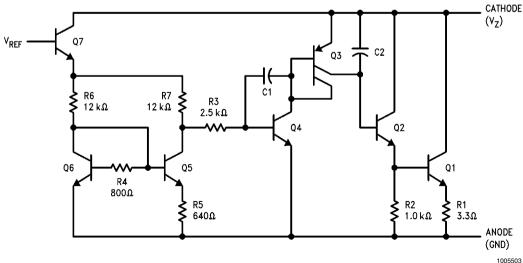

Note 5: The dynamic output impedance,  $r_Z$ , is defined as:

$$r_Z = \frac{\Delta V_Z}{\Delta I_Z}$$

When the device is programmed with two external resistors, R1 and R2, (see  $Figure\ 2$ ), the dynamic output impedance of the overall circuit,  $r_Z$ , is defined as:

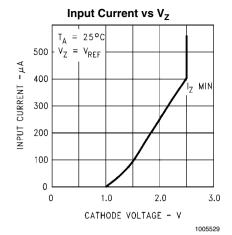

$$r_Z = \frac{\Delta V_Z}{\Delta I_Z} \cong \left[ r_Z \left( 1 + \frac{R1}{R2} \right) \right]$$

## **Typical Performance Characteristics**

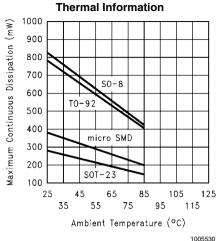

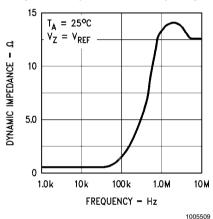

# **Stability Boundary Conditions**

Note: The areas under the curves represent conditions that may cause the device to oscillate. For curves B, C, and D, R2 and V+ were adjusted to establish the initial  $V_Z$  and  $I_Z$  conditions with  $C_L$  = 0.  $V^+$  and  $C_L$  were then adjusted to determine the ranges of stability.
